ONE FIFTH OF THE VALUE OF FINLAND’S GOODS EXPORTS COMES FROM THE FOREST SECTOR

Forest industry products accounted for one fifth of Finland’s total value of export of goods in 2017. The most important market area for Finnish forest industry products is Europe. The value added (EUR 8.4 billion) created by the forest sector contributed over 4% of the Finnish GDP, and the forest sector employed directly about 59,000 people.

SHARE OF STRICTLY PROTECTED FORESTS LARGEST IN EUROPE

The area of strictly protected area accounts for 9% of Finland’s total forest area. The total area of protected forests and forests under restricted use is 2.7 million hectares, or 12% of all forests. Dead wood has an important role in conserving forest biodiversity. The average volume of dead wood on productive forests is 3.2 cubic metres/hectare.

FOREST SECTOR - THE CORNERSTONE OF A SUSTAINABLE AND CIRCULAR BIOECONOMY

In 2017, the value added generated in the forest sector amounted to EUR 8.4 billion, representing 36% of the total value added in the Finnish bioeconomy. This share has remained stable in the 2010s. Due to current increased forest industry investments and an increased sustained felling potential, forestry and the forest industry are expected to play a leading role in the Finnish bioeconomy also in the future.

OVERALL POLICIES

The National Forest Strategy 2015–2025 aims at:
- Creating a competitive operational environment for forest business.
- Renewing the forest sector, and its structure in order to diversify forest products.
- Continuing to use forests according to the principles of sustainable forest management.

The Finnish Bioeconomy Strategy aims at increasing the bioeconomy output to EUR 100 billion by 2025 and to create 100,000 new jobs. Strategic goals are:
- A competitive operating environment for the bioeconomy.
- New business from the bioeconomy.
- A strong bioeconomy competence base.
- Accessibility and sustainability of biomasses. The Finnish forest sector has as central part of Finnish Bioeconomy Strategy.

Finland’s forests contribute to the UN 17 Sustainable Development Goals (SDGs) 2030. A number of the SDG 15 “Life on land” targets and indicators focus explicitly on forests. In addition, forest ecosystems and related services contribute also to other SDGs e.g. on climate actions, clean water, human health, economic growth, clean energy, responsible consumption and production and sustainable cities and communities.

BERRIES, MUSHROOMS AND GAME MEAT ARE IMPORTANT NON-WOOD PRODUCTS

Forest-related services and the use and maintenance of non-wood products are an important component of forest management in Finland. Everyone’s Rights grant the universal right and opportunity to everyone to use forests for recreation, outdoor activities and collecting berries and mushrooms, insofar as this causes no damage or disturbance.
FINLAND - A COUNTRY OF FORESTS
About 22.8 million hectares (75%) is under forests in Finland, representing about 10% of the forest area in Europe (215 million ha). The forest area in Europe increased by 17.5 million ha of over the last 25 years - a result of afforestation and natural forest expansion.*

* Calculated without Russian Federation.

FINLAND'S FORESTS ARE MAINLY OWNED BY PRIVATE PEOPLE AND FAMILIES

ANNUAL INCREMENT OF GROWING STOCK IS HIGHER THAN FELLINGS
According to the Finnish National Forest Inventory (NFI), the annual increment of growing stock was 107 million m³. The annual increment has exceeded the annual drain by about 30%. The amount of harvested volume since the mid-1970s equals to the current volume of the tree stock. The sustained felling potential of Finnish forests is estimated as 83 million m³ per year for the years 2015 to 2024.

FINLAND'S FORESTS ARE A CONSIDERABLE CARBON SINK
The annual net sink of forests varies annually mainly due to harvesting. The average sink has been about 38 million CO₂ equivalent tonnes over the last 10 years. Concurrently the wood products gave a net sink of 2 million tonnes of CO₂. Recently the forest sink has covered about 60% of the Finland’s total emissions excluding the emissions and removals of land use and forestry.

GROWING STOCK HAS STEADILY INCREASED OVER LAST 50 YEARS
According to the Finnish National Forest Inventory (NFI) the volume of growing stock has increased by more than 40% since 1971, being now 2,473 million m³. The most common tree species in Finland are Scots pine (50% of growing stock volume forest land), Norway spruce (30%) and birches (17 %). In Europe, over the last 25 years, the total growing stock in forests has increased by an average of 403 million m³ each year.

FINLAND PROMOTES WOOD AS BUILDING MATERIAL
In Finland, wood accounts for about 40% of all building materials. Nearly 80% of detached houses have a wooden frame. Wood as renewable raw material provides a long-term carbon sequestration potential, and thus is promoted in Finland for use in construction, above all for building blocks of flats in wood.

WOOD-BASED FUELS ACCOUNT FOR ABOUT 25% OF TOTAL ENERGY CONSUMPTION
Using wood for energy increases self-sufficiency in energy production, promotes good silviculture and reduces the use of fossil fuels. Different residues and side streams - such as black liquor, sawdust, bark, woodchips are widely used for the production of heat and electricity. Nowadays sawdust and woodchips are also used for the production of transport biofuels or other bioliquids.

* Small-scale combustion of wood, black liquor and other concentrated liquors, other forest industry by-products and waste products.
