Tiivistelmä

Virallisia lajikekokeita tehdään uusien kasvilajikkeiden viljelyarvon arviomiseksi. Tiedot kasvilajikkeiden saatuoudesta, viljelyominaisuksista ja sadon laadusta auttavat viljelijöitä ja pellon tuotteiden jalostajia valitsemaan oikeat lajikkeet käyttöönsä. Myös kasvilajikeluetteloon ottavat lajikkeet päättäään virallisten lajikekokeiden perusteella.

Lajikkeiden viljelyarvoa arviodaan käytännön viljelyä vastaavissa kenttäkokeissa, joissa uusia lajikkeita verrataan tunnettuihin mitarilajikkeisiin. Kokeet toteutetaan valtakunnallisesti kattavasti, vuonna 2010 kahdellatoista eri koepaikalla. Lisäksi järjestetään erityisiä kokeita viljojen taudinkestävyyden ja ohralajikkeiden happamuudenkestävyyden selvittämiseksi. Leipäviljoista tehdään leivontakokeet.

Uuden kasvilajikkeen viljelyarvo selvitetään kahden vuoden kokeilla. Monivuotisilla nurmikasveilla koejakso kestää kuitenkin perustumisvuoden jälkeen kolme satovuotta. Lajikeluetteloon valituista lajikkeista voidaan peruskoejakson jälkeen tehdä täydentäviä neuvonnallisia kokeita.

Lajikekokeiden tulokset esitetään kahdeksan vuoden yhdistelminä. Tulokset analysoidaan käyttäen lineaarisia sekamalleja.

Avainsanat:

leipävilja, rehuvilja, palkokasvit, öljykasvit, nurmikasvit, peruna

Viralliset lajikekokeet

Virallisen lajikekokeiden tehtävään on selvittää uusien peltokasvilajikkeiden viljelyarvo. Kokeista säädetään maa- ja metsätalousministriön asetuksessa 51/2004. Peltokasvien viralliset lajikekokeet järjestää Maa- ja elintarviketalouden tutkimuskeskus MTT. Kokeet toteutetaan laatuojärjestelmän mukaan.

Kokeissa selvitetään uusien lajikkeiden viljelyarvoa, viljelyvarmuutta, satoisuutta ja laatua. Lajikkeen omistaja ilmoittaa lajikkeen kokeisiin. Lajike on virallisissa kokeissa yleensä kaksi vuotta tai kunnes se hyväksytään kasvilajikeluetteloon. Tämän jälkeen lajike voi olla yhden vuoden täydentävissä kokeissa.

Lajikekokeet tehdään kunkin lajikkeen viljelyyn soveltuvalla alueella. Ne ovat käytännön viljelyä vastaavia kenttäkokeita. Kokeita

on vuonna 2010 ollut kaikkiaan 12 koepaikalla (Kuva 1). Virallisia lajikekokeita ovat suorittaneet MTT:n toimeksiannosta Pro-Agria Nylands Svenska Lantbruksförlaget, Perunantutkimuslaitos, Boreal Kasvinjalostus Oy ja K-maatalouden koetila. Sokerijuurikkaan kokeet hoitaa Sokerijuurikkaan tutkimuskeskus.

Vehnien koelevonnan tehdään Eviran, Elintarviketurvallisuusviraston Viljalaboratoriassa.

Nurmikkokasvien lajikekokeet hoidetaan Pohjoismaissa yhteisesti. Tietoa kokeista on sivulla www.scanturf.org.

Kasvilajikeluetteloon otettavat lajikkeet päättää virallisten lajikekokeiden tulosten perusteella. Lajikeluettelosta päättää Eviran Kasvilajikelautakunta.

Koetulosten tulkinta

Yleistä

Tässä julkaisussa on esitetty virallisten lajikekokeiden tulokset vuosilta 2003–2010. Vehnien leivontalaatutulokset ovat vuosilta 2002–2009.

Tulokset on analysoitu käyttäen lineaarisia sekamalleja (suoravertailu). Tällöin kaikkia lajikkeita voidaan verrata suoraan toisiinsa, sillä malli käyttää koko aineiston hyödykseen yhdellä kertaa.

Satotulokset on esitetty yhteenvedoissa viljelyvyöhykkeen, maalajan, koevuoden ja satotason mukaan ryhmiteltyinä. Nurmikasvien satotulokset on lisäksi laskettu nurmen iän mukaan eriteltyinä.

Viljojen, öljykasvien ja palkoviljojen lajikkeet ovat tuloksissa kasvuajan mukaisessa järjestyskessä. Leivontatulokset ovat jauhosaannon mukaisessa järjestyskessä. Perunalajikkeet on

järjestetty tärkkelyspitoisuuden ja rehunurmilajikkeet satoisuuden mukaan.

Rukiin tulokset esitetään jaoteltuna kolmeen alueeseen: Etelä-Suomi, Länsi-Suomi ja Sisä-Suomi. Etelä-Suomeen luetaan Piikkiön, Inkoon ja Pernajan tulokset sekä aikaisemmilta vuosilta Mietoisten tulokset. Länsi-Suomeen kuuluvat Jokioisten ja Ylistaron tulokset. Muut koepaikat luetaan kuuluviksi Sisä-Suomeen.

Lajikkeiden viihtyvyyttä voi tarkastella maalajan ja satotason mukaan ryhmitellyistä tuloksista. Ohralajikkeilla on eri maalajien kokeiden lisäksi vuosittain happamuudensietokoe, jossa maan pH on erityisen alhainen.

Viljojen ja öljykasvien taudinkestävyykskokeet on tehty taulukossa 1 esitetyillä koepaikoilla.

Official variety trials

Official variety trials are conducted by MTT Agrifood Research Finland to determine the value of new field crop varieties (Ministry of Agriculture and Forestry, Decree 51/2004). The variety trials are performed in accordance with a quality system.

The value, cultivation stability, yield potential and quality of new varieties are evaluated in official variety trials. The proprietor of the variety enters the variety for the trials. The variety undergoes official trials usually for 2 years or until it is entered in the National List of Cultivars. It then undergoes trials for another year to produce additional information about the variety.

The trials take place in areas suitable for the cultivation of the crop in question. Variety trials are field trials that simulate practical cultivation. Trials were conducted at 12

trial sites in 2010 (Figure 1). They have also been conducted by ProAgria Nylands Svenska Lantbruksällskap (a regional agricultural advisory organisation located in the South of Finland), the Potato Research Institute, Boreal Plant Breeding Ltd and the Experimental Farm of the K Group. The sugar beet trials are carried out by the Sugar Beet Research Centre.

The baking tests of wheat are made in the Grain laboratory of the Finnish Food Safety Authority Evira.

Information about Scandinavian turf grass variety trials is available at www.scanturf.org

Decisions on the inclusion of varieties in the National List of Cultivars are based on the results of the official variety trials. The decisions are made by the Plant Variety Board of the Finnish Food Safety Authority Evira.

Evaluation of trial results

General

This annual bulletin presents the results of the official variety trials for 2003-2010. The baking quality results of wheat cover the years 2002-2009.

The results were analysed using linear mixed models, which use all available data in the same analysis. In the results all varieties can be compared directly with each other.

The summaries also give yields by cultivation zone, soil, trial year and yield level. The yields of grasses were calculated by the age of the lay. The number of trial results is given only for yields.

The varieties of cereals, oilseeds and pulses are sorted by growing time. The baking quality results are sorted by flour yield. The po-

tato varieties are sorted by starch content. Total yield is used as the sorting factor for feed grass varieties.

The yields of rye are given separately for three regions: Southern Finland, Western Finland and Inner Finland. Piikkiö, Inkoo and Pernaja (and also Mietoinen from previous years) are included in Southern Finland. Jokioinen and Ylistaro are included in Western Finland. All the other trial sites are in Inner Finland.

The adaptability of varieties can be evaluated from the results classified by soil type and yield level. For barley the tolerance of acidic soils is tested in separate trials.

The grain and oilseed trials with fungicide treatment were conducted at the sites shown

Koejärjestely on strip-plot koeasetelman mukainen. Kasvitaalien torjuntakäsittely on tehty kaistoina lajikeruutujen yli.

Vuonna 2010 taudinkestävyyskokeissa käytettiin seuraavia valmisteita: Syysviljojen ruiskutus syksyllä: Sportak (prokloratsi). Syys- ja kevätiljat kasvukaudella: Stereo (syprodiniil ja propikonatsoli) tai proline (protiokonatsoli).

Rypsi ja rapsi: Sportak (prokloratsi)

Aineisto on analysoitu sekamallilla, jossa lajike ja ruiskutuskäsittely ovat kiinteitä tekijöitä. Lohko ja koe ovat puolestaan normaalista jakautuneita satunnaistekijöitä. Yhdysvaikutukset on määritelty satunnaisiksi, kun vähintään yksi yhdysvaikutusten tekijöistä on ollut satunnainen.

Ohjeita tulosten tulkintaan:

- Kokeita (kpl) ilmoittaa, kuinka monessa kokeessa lajike on ollut.
- Sato (kg/ha) on lajikkeen vertailukelpoinen sato keskimääräisissä kasvuolosuheteissa. Sato ilmoitetaan viljoilla 15 prosentin ja öljykasveilla 9 prosentin kosteudessa.
- Suhdeluku (Sl) on lajikkeen keskimääräinen suhteellinen sato verrattuna mittarin satoon.
- Nurmikasvien sadot ilmoitetaan kuiva-ainesatoina (kg/ha ka).

Viljat, palko- ja öljykasvit

Talvituho (%) kuvaa talvituhon keskimääräistä osuutta kasvustosta. Tällöin 100 on täysin tuhoutunut.

Lako (%) kertoo kasviston keskimääräisestä lakoutumisasteesta. Luku 100 tarkoittaa täysin lakoutunutta kasvusta.

Kasvuaika (vrk) on jakso kylvöstä keltatuleentumiseen.

Tehoisä lämpösumma (astepäivää) saadaan, kun lasketaan yhteen kasvukauden vuorokausien keskilämpötilat, joista on vähennetty kynnsarvo viisi astetta (+5 °).

Korkeus (cm) kertoo kasviston keskimääräisen korkeuden.

1000 jyvä paino (g) on 1 000 siemenen paino.

Hehtolitrapaino (kg) on sadon tilavuuspaino.

Valkuaispitoisuus (%) kertoo, paljonko sadon kuiva-aineessa on valkuista.

Kuori (%) kuvaa kauran kuoren osuutta sadosta.

Sakoluku 1 on sakoluku normaalina viljankorjuuaikana.

Sakoluku 3 on sakoluku 2–4 viikkoa normaalista korjuuajankohdasta.

Valkuaissato (kg/ha) kertoo valkuaisen määräni kuiva-aineessa.

Öljypitoisuus (%) kertoo, sadon öljypitoisuuden (9 % kosteudessa).

Öljysato (kg/ha) on öljysadon määräni kuiva-ainesadossa.

Lehtivihreäpitoisuus (ppm) kertoo, paljoko siementen öljy sisältää lehtivihreää milligrammoina kilossa.

Keitto 60 min (%) kuvaa pehmenneiden herneiden osuutta, kun niitä on keitetty tunti.

in Table 1. The experimental design at each site was a strip-plot design.

Following fungicides were used in the fungicide treatment trials in 2009:

Winter cereals in autumn: Sportak (prochloraz)

Winter- and spring cereals during growing season:

Stereo (syprodinil ja propiconatsol) or Proline (prothioconazole).

Oilseeds: Sportak (prochloraz)

The data were analysed using the mixed model approach, in which the variety and fungicide treatments are assumed to be fixed effects and the trial and block to be normally distributed random effects. Interaction effects involving at least one random effect are also defined as random.

Detailed instructions on reading the tables are given in the following.

- Trials (no) shows the number of trials in which the variety was included.
- Yield (kg/ha) is the estimated mean yield of the variety in average environmental conditions. Grain yields are calculated at 15% and oilseed yields at 9% moisture content.
- Rel. is the average yield of the variety relative to the yield of the control variety.
- Grass yields are calculated at dry matter yields

Cereals, pulses and oilseeds

Winter damage (%) is the average proportion of winter damaged stand, 100 = total loss.

Lodging (%) is the average degree of lodging in the stand, 100 = completely lodged.

Growing time (days) is the time from sowing to yellow ripening.

Growing degree days (dd) are calculated from sowing to yellow ripening. +5°C is used as the threshold value.

Length (cm) is the average length of the stand.

1000-seed weight (g) is the weight of 1000 seeds of the yield.

Hectolitre weight (Hl-weight, kg) is the weight of 100 litres of the yield.

Protein content (%) is the protein content of the yield as a percentage of dry matter.

Husk (%) is the proportion of oat husk in the yield.

Falling number 1 is the falling number at the normal cereal harvesting time.

Falling number 3 is the falling number 2–4 weeks after the normal harvesting time.

Protein yield (kg/ha) is the amount of protein in the dry matter.

Oil content (%) is the oil content of the yield (9 % moisture).

Oil yield (kg/ha) is the amount of the oil yield of the dry matter.

Chlorophyll content (ppm) is the chlorophyll content (mg/kg) in the seed oil.

Cooking 60 min is the (%) percentage of soft peas after one hour of cooking.

Vehnän leivontalaatu

Jauhosanto (%) ilmaisee jauhon määrään jauhetusta jyvämaärästä.

Sakoluku (s) esitetään jauhon sakolukuna.

Valkuais-% esitetään valkuaispitoisuutena jauhon kuiva-aineesta.

Kostea sitko (%) on kostean sitkon määrä jauhosta.

Zeleny-luku on mittalaisissa isopropylalkoholin ja maitohapon seoksessa sekoitetun jauhon liettyneen sitkopatsaan korkeus.

Vedensidonta (%) on vesimäärä jauhon (kosteus 14 %) painosta. Tämä vesimäärä tarvitaan valmistettaessa jauhosta määrätyyn kiinteyden omaava taikina.

Valorimetriluku ilmaisee taikinan muodos-tumisajan, sekoituskestävyyden ja pehmene-misen. Se määritetään erityisellä mitta-astei-kolla farinogrammista.

Ekstensogrammin pituus (mm) eli taiki-nan venyyvyys on ekstensografin piirtämän käyrän pituus, kun taikinaa venytetään kat-keamiseen asti.

Ekstensogrammin korkeus (FU) eli taiki-nan venytysvastus on ekstensografin piirtämän käyrän korkeus, kun taikinaa venytetään kat-keamiseen asti.

Leipätilavuus (ml) on koeleivonnalla paiste-tun vuokaleivän tilavuus.

Huokoisuus (1–8) koelevästä leikatun lei-päviipaleen huokosten koko Dallmannin Po-rentabelle -asteikolla. Kun huokosten koko on suuri ja epätasainen arvosana on 1, ja kun huokoset ovat pieniä ja tasaisia arvosana on 8.

Kimmoisuuus (0–10) leivän sisuksesta leika-tun kuution palautuminen painamisen jäl-

keen senttimetreinä asteikolla 0 (=2 cm) – 10 (=5 cm).

Arvoluku on (tilavuustekijä x huokoisuus-tekijä):100. Taulukon avulla muutetaan leivän tilavuus ja huokoisuus tilavuus- ja huokoisuustekijöiksi

Peruna

Tärkkelys (%) ilmoittaa perunan tärkkelyspitoisuuden.

Kauppakelponen sato (%) on ulkoisen laa-dun arvostelussa luokkaan terveet sijoitettu-jen 35–70-millimetristen perunoiden sato. Ulkoisen laadun vaatimuksset vastaavat lä-hinnä ruokaperuna-asetuksen erikoislukon perunan laatuvaatimuksia.

Myöhäisyys (1–9) on arvioitu kokeissa kol-masti 15. elokuuta alkaen 10 vuorokauden välein. Tässä tiedotteessa on esitetty kol-mannen havaintokerran tulokset. 9 on täy-sin tulehtunut.

Mukulan ominaisuudet ja ulkonäkö

Ulkonäkö kuorineen (1–9). 9 tarkoittaa pa-rasta ulkonäköä, 1 on kuori pilalla.

Mukulan pyöreys (1–9). 9 on pyöreä muku-la, 1 on pitkänomainen mukula.

Mukulan litteys (1–9). 9 on poikkileikkauk-seltaan pyöreä mukula, 1 on poikkileikkauk-seltaan litteä mukula.

Mukulan sileys (1–9). 9 on sileä mukula, 1 on hyvin syväilmäinen ja/tai kyhmyinen mukula

Mukulamuodon säännöllisyys (1–9). 9 tar-koittaa säännöllistä mukulamuotoa, vähiten vaihtelevaa, 1 tarkoittaa hyvin vaihtelevaa mukulamuotoa

Baking quality of wheat

Flour yield (%) presents the flour amount of the milled grain amount.

Falling number (s) presents the falling number of the flour.

Protein content % presents protein content on dry matter basis.

Wet gluten (%) is the amount of wet gluten from flour amount.

Zeleny number is the height of flour gluten pole after shaked in glass isopropyl alcohol and milk acid.

Water absorption (%) is the amount of water of flour weight (moisture 14 %). This water amount is needed to get certain consistency of dough.

Valorimeter value is quality score based on dough development time and tolerance to mixing. It is measured with special measure template from farinogram.

Ekstensograp length (mm) or extensibility of the dough is the length of curve drawn by ekstensografi, when dough is stretched until broken.

Ekstensograp height (FU) or resistance of dough, the height of curve which ekstensografi draw when dough is stretched until broken.

Loaf volume (ml) is the volume of the experiment bread baked in the pan.

Grumb structure (1-8) the volume of the pores of cut from the experiment bread. Dallmanns Porentabelle -scale is used. When the pores are big and uneven the value is 1, and when the pores are small and even the value is 8.

Grumb resilience (0-10) is the end height after pressed loaf cubic, the centimetre scale is 0 (=2 cm) – 10 (=5 cm).

Quality number is (loaf volume value x grumb structure value):100. With the table loaf volume and grumb structure are turned to score point values.

Potato

Starch (%) is the starch content of potato.

Marketable yield (%) is the yield classified in the external quality evaluation as healthy, size class 35–70 mm. The requirements for external quality correspond mainly to those of the special class in the Finnish Potato Decree.

Maturity (1–9). 9 = fully mature. In the trials, lateness was evaluated three times at intervals of 10 days starting on 15 August. The results of the third observation are given in this bulletin.

Tuber properties and appearance

Smoothness of skin (1–9). 9 = best appearance, 1 = skin spoiled.

Roundness of tuber (1–9). 9 = round, 1 = elongated.

Flatness of tuber (1–9). 9 = round in cross section, 1 = flat in cross section.

Shallowness of eyes (1–9). 9 = smooth tuber, 1 = very deep eyes and/or knobby tuber.

Uniformity of tuber shape (1–9). 9 = very regular, least variable 1 = very variable.

Ulkoinen laatu

Ulkoiden laadun arvioinnissa määritetään eri tavalla vioittuneiden mukuloiden osuus painoprosentteina seuraavissa vioitustypeissä:

Terveet (%). Ei vioituksia tai vikoja.

Rupi (%). Mukulat, joissa yli 10 prosenttia pinnasta ruven peitossa.

Mukularutto (%).

Muut sienimädät (%).

Bakteerimädät (%).

Mekaaniset pintaviat (%). Kuori vahingoittunut, eikä vika poistu normaalissa kuo

Mekaaniset maltoviat (%). Ehyen kuoren alla olevat mekaaniset vauriot, jotka eivät poistu normaalissa kuorinnassa.

Nestejännityshalkeamat (%). Vioitus ei poistu normaalissa kuorinnassa.

Korkkiutuneet halkeamat (%). Vioitus ei poistu normaalissa kuorinnassa.

Ontot ja keskeltä ruskettuneet (%).

Epämuotoiset (%). Lajikkeelle ominaisen muodon poikkeama, joka aiheuttaa vaikeuksia konekuorinnassa. Korjaaminen leikkamalla aiheuttaa yli 25 prosentin tappion.

Mallon värvirheet (%). Mallon värimuutos, jolle ei ole mekaanista syytä. Tähän ryhmään luetaan myös maltokaariviruksen aiheuttamat vioitukset ja johtojänneviat.

Vihertyneet (%).

Muut viat (%). Perunan kauppakelpoisuuden vaikuttava vika, joka ei kuulu mihinkään edellä mainittuun ryhmään.

Rehu- ja energianurmetyyppitunnukset

Sadot (kg/ha) ilmoitetaan kuiva-aineena.

Botaaninen analyysi (%) kertoo kokeiltavan kasvin osuuden sadosta. Määritys on huomioidtu sadon määrässä, joka ilmoittaa koekasvin puhtaana sadon.

Röyhylle tai tähkälle tulo ja kukkimisen alkaminen (vrk) on päivä, jolloin viisi prosenttia kasveista kyseisessä kehitysvaiheessa. Kehitysvaihe ilmoitetaan vuorokausina toukokuun 1. päivästä lukien

Kevättihleys (%) ilmoitetaan kasvun selvästi alettua, 100 tarkoittaa täystihää.

Talvituho (%) 100 tarkoittaa täysin tuhoutunutta.

Nurmisodon laatu määritetään NIRS-teknikalila eli lähi-infrapuna-heijastusspektroskopialla.

D-arvo (%) Sulavan orgaanisen aineen osuus kuiva-aineesta.

NDF (%) Neutraalidetergentikuitu eli solunseinämäkuitu.

ADF (%) Happoon liukenevaton kuitu.

Ligniini (%) Ligniinipitoisuus.

Valkuaisato (kg/ha) NIRS-analyysin typpiarvon perusteella kertoimella 6,25 laskettu sadon valkuaispitoisuus on kerrottu sadolla.

Käyttökelpoinen sato (kg/ha). Sadon sulavan kuiva-aineen määrä hehtaaria kohti.

Tilastollinen merkitsevyys

Merkitsevyydet ilmoittavat kuinka todennäköistä on, että ero testattavan lajikkeen ja mittarilajikkeen välillä on pelkästään sattumasta johtuvaa. Käytetyt tasot ovat seuraavat:

External appearance

The evaluation of the external appearance is based on the proportion of tubers damaged in different ways, expressed as the percentage by weight in the following groups according to the type of damage:

Healthy tubers (%). Tubers without injuries or defects causing rejection.

Common scab (%). Over 10% of tuber surface.

Tuber blight (%).

Other fungal disease (%).

Bacterial disease (%).

Mechanical damage (%). Skin damage which is not removed by normal peeling

Internal bruising (%). Internal bruising which is not removed by normal peeling.

Harvest crack (%). Injury which cannot be removed by normal peeling.

Growth crack (%). Injury which cannot be removed by normal peeling.

Hollow heart (%). Hollow and dark heart.

Deformations (%). Deviation from the shape typical of the variety which causes difficulty in mechanical peeling; correction by cutting causes a loss of over 25%.

Discoloration (%). Discoloration of flesh which is not due to a mechanical reason. Injuries caused by mop top virus are included in this group

Sun greening (%).

Other defects (%). A defect affecting the marketability of the potato not included in any of the above mentioned groups.

Grasses for feed and biofuel

Yields (kg/ha) are expressed as dry matter yields.

Botanical analysis (%). Percentage in yield of the species tested. The evaluation is included in the size of the yield which states the net yield of the tested species.

Coming into ear and start of blossoming (days) date when 5% of the individual plants have reached this stage of development. This stage of development is expressed in days as of 1 May.

Covering % (spring) (100 = full cover) is estimated when growth has clearly started.

Winter damage (%). 100 = total damage.

NIRS (near infrared spectroscopy) is used to determinate the quality of grass.

D value (%) Digestible organic matter in the dry matter

NDF (%) Neutral Detergent Fiber.

ADF (%) Acid Detergent Fiber.

Lignin (%). Lignin content

Protein yield (kg/ha). Protein content based on NIRS analysis.

Digestible yield (kg/ha). Digestible organic matter in the dry matter yield.

Statistical significance

Significance levels show how likely a difference between test and control variety is due to chance. The levels used are:

o = merkitsevä 10 prosentin tasolla
* = merkitsevä 5 prosentin tasolla
** = merkitsevä 1 prosentin tasolla
*** = merkitsevä 0,1 prosentin tasolla

Additonal information

A quality manual for variety trials, instructions for use and other relevant information are available (in Finnish) at www.mtt.fi/lajikekokeet.

Researchers

Arjo Kangas

MTT Plant Production Research, Ylistaro
Head of the official variety trials, potato,
after 1.10.2010 oats.

Antti Laine

MTT Plant Production Research, Piikkiö
Winter rye, spring rye, pea, broad bean,
narrow-leaved lupin, maize, after 1.10.2010
- barley.

Markku Niskanen

MTT Plant Production Research, Ylistaro
Timothy, meadow fescue, cocksfoot, perennial ryegrass, Italian ryegrass, westerwoldian ryegrass, red clover, white clover, reed canary grass, red fescue, Kentucky bluegrass.

Yrjö Salo

MTT Plant Production Research, Piikkiö,
Triticale, winter wheat, spring wheat, spring turnip rape, winter turnip rape, spring rape, linseed, camelina, sunflower.

Martti Vuorinen

MTT Plant Production Research, Piikkiö (until
30.9.2010) Barley, oats.

Lauri Jauhainen

MTT, Plant Production Research, Jokioinen,
Statistical methods.

Hannele Nikander

MTT Service Unit, Jokioinen, Database and computing.

Viralliset lajikekokeet

Uusien peltokasvilajikkeiden viljelyarvo selvitetään virallisilla lajikekokeilla, joita MTT tekee vuosittain. Kokeissa tutkitaan käytännön viljelyä vastaavissa olosuhteissa uusien lajikkeiden satoisuutta, viljelyominaisuuksia ja sadon laatua.

Tässä julkaisussa esitellään virallisten lajikekokeiden tulokset vuosilta 2002–2009. Vuonna 2009 kokeita tehtiin 12 eri koepaikalla. Vehnien leivontalaatua koskevat tulokset ovat vuosilta 2002–2008. Tulokset on analysoitu lineaarisilla sekamalleilla, jolloin kaikkia lajikkeita voidaan verrata suoraan toisiinsa.

Virallisten lajikekokeiden tuottamat tiedot auttavat viljelijöitä ja pellon tuotteiden jatkopalostajia valitsemaan käyttöönsä sopivimmat kasvilajikkeet. Lisäksi Evira päätää kokeiden tulosten perusteella, otetaanko uusi lajike kansalliseen kasvilajikeluetteloon.

MTT julkaisee tutkimustuloksiaan kahdessa raportisarjassa:
MTT Kasvu ja MTT Tiede.

MTT KASVU
www.mtt.fi/julkaisut

MTT Kasvu -sarjassa julkaistaan oppaita ja raportteja maatalous- ja elintarviketutkimuksesta sekä maatalouden ympäristötutkimuksesta. Tuloksista kerrotaan käytännönläheisesti ja ymmärrettävästi. Lukijoille tarjotaan tietoa MTT:n kaikilta tutkimusaloilta eli biologiasta, teknologiasta ja taloudesta.

MTT, 31600 Jokioinen, puh. (03) 41881, sähköposti julkaisut@mtt.fi
