1 Viralliset lajikekokeet

Virallisen lajikekokeiden tehtävänä on selvittää uusien peltokasvilajikkeiden viljelyarvo. Peltokasvien viralliset lajikekokeet järjestää MTT. Toimintaa johtaa MTT:n Alueellinen yksikkö.

Uusien lajikkeiden viljelyarvoa, viljelyvarmuutta, satoisuutta ja laatua selvitetään alustavissa ja virallisissa lajikekokeissa. Kasvinjalostuslaitos tai lajikkeen omistaja ilmoittaa lajikkeen kokeisiin ja vastaa niiden kustannuksista. Lajike on virallisissa kokeissa vähintään kaksi vuotta tai kunnes se hyväksytään Maa- ja metsätalousministeriön kasvilajikeluetteluun. Tämän jälkeen lajike on kokeissa vielä kaksi–kolme vuotta neuvonnan tarpeita varten.

Lajikekokeet tehdään kunkin lajikkeen viljelyyn soveltuvalla alueella. Ne ovat käytännön viljelyä vastaavia kenttäkokeita. Kokeita on vuonna 2001 ollut kaikkiaan 17 koepaikalla (Kuva 1). Virallisia lajikekokeita ovat suorittaneet MTT:n toimeksiannosta myös Mildola Oy, Kemira Agro Oy ja Perunantutkimuslaitos. Sokerijuurikkaan kokeet hoitaa Sokerijuurikkaan tutkimuskeskus.

Maa- ja metsätalousministeriön kasvilajikeluetteluun otettavat lajikkeet päätetään virallisten lajikekokeiden tulosten perusteella.

1 The official variety trials

Official variety trials are conducted by the MTT Agrifood Research Finland to determine the value of new field crop varieties. Operations are organised by the Regional Unit of the MTT Agrifood Research Finland.

The value, cultivation stability, yield potential and quality of new varieties are evaluated in preliminary and official variety trials. The owner of the variety enters the variety for the trials and covers the expenses involved. The variety undergoes official trials for at least 2 years or until it is entered in the National List of Cultivars of the Ministry of Agriculture and Forestry of Finland. Thereafter it undergoes trials for another 2–3 years to product information for growers.

The trials take place in areas suitable for the cultivation of the crop in question. Variety trials are field trials that simulate practical cultivation. Trials were conducted at 17 trial sites in 2001 (Figure 1). They have also been conducted by Mildola Oy, Kemira Agro Ltd. and the Potato Research Institute, commissioned by the MTT Agrifood Research Finland. The sugar beet trails are done by the Sugar Beet Research Centre.

Decisions on the inclusion of varieties in the National List of Cultivars of the Ministry of Agriculture and Forestry of Finland are based on the results of the official variety trials

2 Laatujärjestelmä

MTT:n lajikekoetointia hoidetaan ISO 9002-standardoidun laatujärjestelmän mukaan.

Lajikekokeiden laatukäsikirja, suoritussuhteet ja muuta lajikekokeisiin liittyvää tietoa on suomeksi MTT:n Internet-sivuilla osoitteessa <http://www.mtt.fi/atu/epo/lajike.html>.

SFS-EN ISO 9002

3 Koetulosten tulkinta

3.1 Yleistä

Tässä julkaisussa on esitetty virallisten lajikekokeiden tulokset vuosilta 1994–2001. Tulokset kertovat, miten lajike menestyy parivertailuna mittarilajikkeeseen verrattuna. Mittarilajikkeen tulokset ovat keskiarvo kaikista kokeista, joissa se on ollut mukana. Muiden lajikkeiden tulokset ovat puolestaan poikkeamia mittarin tuloksista niissä kokeissa, joissa lajike on ollut samanaikaisesti mittarilajikkeen kanssa. Tulokset eivät ole peräisin tarkalleen samoista kokeista, joten taulukoissa olevia lajikkeita ei voida vertailla suoraan keskenään.

Poikkeuksen tekee nurmikoiden kokeet ja viljoilla taudinkestävyyskokeet, jotka on analysoitu käyttäen lineaarisia sekamalleja (suoravertailu), jolloin lajikkeita voidaan verrata suoraan toisiinsa

2 Quality system

The variety trials are performed in accordance with a quality system, which meets the standard SFS-EN ISO 9002.

A quality manual for variety trials, instructions for use and other relevant information are available (in Finnish) from the internet server of the MTT Agrifood Research Finland at <http://www.mtt.fi/atu/epo/lajike.html>.

ISO 9002

3 Evaluation of trial results

3.1 General

This annually bulletin presents the results of the official variety trials for 1994–2001. The results show the success of the variety in relation to a reference variety. The results for these varieties are the mean of all the trials in which the variety has been included. The results for the other varieties are given as deviations from the results for the reference variety in the trials in which the variety has participated at the same time as the reference variety. Because of this pair wise comparison, the varieties on the list cannot be compared directly with each other, as the results do not refer to exactly the same trials.

However, the turf grass trials and the grain trials with fungicide treatment were analysed using linear mixed models and all varieties can be compared directly with each other.

Yhteenvedoissa ovat mukana satotulokset viljelyvyöhykkeen, maalajin ja koevuoden mukaan ryhmiteltyinä. Nurmikasvien satotulokset on lisäksi laskettu nurmien mukaan eriteltyinä.

Rukiin tulokset esitetään jaoteltuna kolmeen alueeseen: Etelä-Suomi, Länsi-Suomi ja Sisä-Suomi. Etelä-Suomeen luetaan Mietoisten, Vihdin ja Tuusulan tulokset. Länsi-Suomeen kuuluvat Joki-oisten ja Ylistaron tulokset. Muut koepaikat luetaan kuuluviksi Sisä-Suomeen.

Lajikkeiden viihtyvyyttä ja happamuuden sietokykyä voi tarkastella maalajin mukaan ryhmitellyistä tuloksista. Liejusavella olleet ohrakokeet ovat happamuudensietokokeita, joissa maan pH ja viljavuus ovat erityisen alhaisia.

Viljojen taudinkestävyyskokeet on tehty taulukossa 1 esitetyillä koepaikoilla. Näissä kokeissa on joko torjuttu kasvi-tauteja tai ne on jätetty torjumatta. Tämän jälkeen on mitattu lajikkeiden sato. Koejärjestely on ollut jokaisella koepaikalla strip-plot –koeasetelman mukainen. Kasvitautien torjuntakäsittely on tehty kais-toina lajikeruutujen yli. Aineisto on analysoitu sekamallilla, jossa lajike ja ruis-kutuskäsittely ovat olleet kiinteitä tekijöitä. Lohko ja koe ovat olleet puolestaan normaalisti jakautuneita satunnaistekijöitä. Yhdysvaikutukset on määritelty satunnaisiksi, jos vähintään yksi yhdysvaikutusten tekijöistä on ollut satunnainen.

Seuraavassa on ohjeita tulosten tulkin-taan.

Viljelyvyöhyke-sarake kertoo, miltä alu-eelta tulokset on laskettu. Mukana ei ole tuloksia mittarin viljelyaluetta pohjoi-sempaa. Kokeita ei myöskään välttämättä ole ollut kaikilla tässä ilmoitetuilla vyö-hykkeillä.

Kokeita (kpl) ilmoittaa, kuinka monessa kokeessa lajike on ollut samanaikaisesti mittarin kanssa.

The summaries also give yields by culti-vation zone, soil and trial year. The yields of grasses were calculated by the age of the lay. The number of trial results is given only for yields.

The yields of rye are given separately for three regions: Southern Finland, Western Finland and Inner Finland. Fields of Mietoinen, Vihti and Tuusula are included in Southern Finland and those of Jokioinen and Ylistaro in Western Finland. All other trial sites are in Inner Finland.

The adaptability of varieties and their resistance to acidity can be evaluated from the results classified by soil type. The barley trials on gytty clay are trials of acidity resistance in cases where the pH and fertility of the soil are particu-larly low.

The grain trials with fungicide treatment were conducted at sites as shown in the table 1 “Trial sites of cereals, pulses and oilseeds 2001”.

The experimental design at each site was strip-plot design. Data were analysed using the mixed model approach, in which variety and fungicide treatments are assumed to be fixed effects and trial and block to be normally distributed random effects. Interaction effects involving at least one random effect are also de-fined as random.

Detailed instructions on reading the ta-bles are given in the following.

The cultivation zone column shows the area from which the results were calcu-lated. The calculations do not include data from further north than the cultiva-tion area of the reference.

Tests were not necessarily performed in all zones listed here.

Trials (no) shows the number of trials in which the variety was included at the same time as the reference variety.

Sato (kg/ha) on lajikkeen keskimääräinen sato niistä kokeista, joissa se on ollut mittarin kanssa samanaikaisesti. Sato ilmoitetaan viljoilla 15 prosentin ja öljykasveilla 9 prosentin kosteudessa.

Suhdeluku (SI) on lajikkeen keskimääräinen suhteellinen sato verrattuna mittarin satoon.

3.2 Viljat, palko- ja öljykasvit

Talvituho (%) kuvaa talvituhon keskimääräistä osuutta kasvustosta. Tällöin 100 on täysin tuhoutunut.

Lako (%) kertoo kasvuston keskimääräisestä lakoutumisasteesta. 100 on täysin lakoutunut.

Kasvuaika (vrk) on jakso kylvöstä keltatuleentumiseen.

Korkeus (cm) kertoo kasvuston keskimääräisen korkeuden.

1000 jyvän paino (g) on 1 000 siemenen paino.

Hehtolitraino (kg) on sadon tilavuuspaino.

Valkuaispitoisuus (%) kertoo, paljonko sadon kuiva-aineessa on valkuaista.

Kuori (%) kuvaa kauran kuoren osuutta sadosta.

Sakoluku 1 on sakoluku normaalina viljankorjuuajkana.

Sakoluku 3 on sakoluku kaksi–neljä viikkoa normaalista korjuuajankohdasta.

Valkuaissato (kg/ha) kertoo valkuaisen määrän kuiva-aineessa.

Öljypitoisuus (%) kertoo, paljonko sadon kuiva-aineessa on öljyä.

Öljysato (kg/ha) on öljysadon määrä kuiva-ainesadossa.

Yield (kg/ha) is the average yield of the variety from the trials in which it participated at the same time as the reference. Grain yields are calculated to 15% and oilseed yields to 9% moisture content.

Rel. is the average yield of the variety relative to with the yield of the control variety.

3.2 Cereals, pulses and oilseeds

Winter damage (%) is the average proportion of winter damaged stand, 100 = total loss.

Lodging (%) is the average degree of lodging in the stand, 100 = completely lodged.

Growing time (days) is the time from sowing to yellow ripening.

Length (cm) is the average length of the stand.

1000-seed weight (g) is the weight of 1000 seeds of the yield.

Hectolitre weight (HI-weight, kg) is the weight of 100 litres of the yield.

Protein content (%) is the protein content of dry matter of the yield.

Husk (%) is the proportion of oat husk in the yield.

Falling number 1 is the falling number at the normal cereal harvesting time.

Falling number 3 is the falling number 2–4 weeks after the normal harvesting time.

Protein yield (kg/ha) is the amount of protein in the dry matter.

Oil content (%) is the oil content of the dry matter.

Lehtivihreäpitoisuus (ppm) kertoo, paljonko siementen öljy sisältää lehtivihreää milligrammoina kilossa.

Keitto 60 min (%) kuvaa pehmenneiden herneiden osuutta, kun niitä on keitetty tunti.

3.3 Peruna

Tärkkelys (%) ilmoittaa perunan tärkkelyspitoisuuden.

Kauppakelpoinen sato (%) on ulkoisen laadun arvostelussa luokkaan terveet sijoitettujen 35–70-millimetrinen perunoiden sato. Ulkoisen laadun vaatimukset vastaavat lähinnä ruokaperuna-asetuksen erikoisluokan perunan laatuvaatimuksia.

Myöhäisyys (1–9) on arvioitu kokeissa kolmasti 15. elokuuta alkaen 10 vuorokauden välein. Tässä tiedotteessa on esitetty kolmannen havaintokerran tulokset. 9 on täysin tulehtunut.

Mukulan ominaisuudet ja ulkonäkö

Ulkonäkö kuorineen (1–9). 9 tarkoittaa parasta ulkonäköä, 1 on kuori pilalla.

Mukulan pyöreys (1–9). 9 on pyöreä mukula, 1 on litteä mukula.

Mukulan litteys (1–9). 9 on poikkileikkaukseltaan pyöreä mukula, 1 on poikkileikkaukseltaan litteä mukula.

Mukulan sileys (1–9). 9 on sileä mukula, 1 on hyvin syväsilmainen ja/tai kyhmyinen mukula.

Mukulamuodon säännöllisyys (1–9). 9 tarkoittaa säännöllistä mukulamuotoa, vähiten vaihtelevaa, 1 tarkoittaa hyvin vaihtelevaa mukulamuotoa.

Ulkoisen laatu

Arvioinnissa määritetään eri tavalla vioittuneiden mukuloiden osuus painoprosentteina seuraavissa vioitustyypeissä:

Oil yield (kg/ha) is the amount of the oil yield of the dry matter.

Chlorophyll content (ppm) is the chlorophyll content (mg/kg) in the seed oil.

Cooking 60 min (%) percentage of soft peas after one hour of cooking.

3.3 Potato

Starch (%). The starch content of potato.

Marketable yield (%) is the yield classified in the external quality evaluation as healthy, size class 35–70 mm. The requirements for external quality correspond mainly to those of the special class in the Finnish Potato Decree.

Maturity (1–9). 9 = completely ripe. In the trials, lateness was evaluated three times at intervals of 10 days starting on 15 August. The results of the third observation are given in this bulletin.

Tuber properties and appearance:

Smoothness of skin (1–9). 9 = best appearance, 1 = skin spoiled.

Roundness of tuber (1–9). 9 = round, 1 = flat.

Flatness of tuber (1–9). 9 = round in cross section, 1 = flat in cross section.

Shallowness of eyes (1–9). 9 = smooth tuber, 1 = very deep eyes and/or knobby tuber.

Uniformity of tuber shape (1–9). 9 = very regular, least variable 1 = very variable.

External appearance:

The evaluation of external appearance is based on proportion of tubers damaged in different ways, expressed as the percentage by weight in the following groups according to type of damage:

Terveet (%). Ei vioituksia tai vikoja.

Rupi (%). Mukulat, joissa yli 10 prosenttia pinnasta ruven peitossa.

Mukularutto (%).

Muut sienimädät (%).

Bakteerimädät (%).

Mekaaniset pintaviat (%). Kuori vahingoittunut, eikä vika poistu normaalissa kuorinnassa.

Mekaaniset maltoviat (%). Ehyen kuoren alla olevat mekaaniset vauriot, jotka eivät poistu normaalissa kuorinnassa.

Nestejännityshalkeamat (%). Vioitus ei poistu normaalissa kuorinnassa.

Korkkiutuneet halkeamat (%). Vioitus ei poistu normaalissa kuorinnassa.

Ontot ja keskeltä ruskettuneet (%).

Epämuotoiset (%). Lajikkeelle ominaisen muodon poikkeama, joka aiheuttaa vaikeuksia konekuorinnassa. Korjaaminen leikkaamalla aiheuttaa yli 25 prosentin tappion.

Mallon värivirheet (%). Mallon värimuutos, jolle ei ole mekaanista syytä. Tähän ryhmään luetaan myös maltokaariviruksen aiheuttamat vioitukset ja johtojänneviat.

Vihertyneet (%).

Paleltuneet (%).

Muut viat (%). Perunan kauppakelpoisuuteen vaikuttava vika, joka ei kuulu mihinkään edellä mainittuun ryhmään.

Keittolaadun muuttujat

Ulkonäkö keitettynä (1–9). 9 on erinomainen.

Healthy tubers (%) Tubers without injuries or defects causing rejection.

Common scab (%). Over 10% of tuber surface.

Tuber blight (%).

Other fungal disease (%).

Bacterial disease (%).

Mechanical damage (%). Skin damaged and the injury cannot be removed by normal peeling.

Internal bruising (%). Internal bruising which is not removed by normal peeling.

Harvest crack (%). Injury which cannot be removed by normal peeling.

Growth crack (%). Injury which cannot be removed by normal peeling.

Hollow heart (%). Hollow and dark heart.

Deformations (%). Deviation from the shape typical of the variety which causes difficulty in mechanical peeling; correction by cutting causes a loss of over 25%.

Discoloration (%). Discoloration of flesh which is not due to a mechanical reason. Injuries caused by mop top virus are included in this group.

Sun greening (%).

Frost damage (%).

Other defects (%). A defect affecting the marketability of the potato not included in any of the above mentioned groups.

Quality after cooking

Skin cooked (1–9). 9 = excellent.

Mallon väri keitettynä (1–9). 9 on tumman keltainen, 7 on keltainen, 5 on vaalean keltainen, 3 on valkoinen, 1 on harmaan kirjava.

Jauhoisuus. 9 kuvaa suurinta jauhoisuutta.

Maku (1–9). 9 on paras maku.

Tummuminen keitettynä (1–9). 9 on vähiten tummumista.

Raakatummuminen (1–9). 9 on vähiten raakatummumista.

Rikkikiehuminen (1–9). 9 on vähiten rikkikiehumista.

Rasvakeittoväri (0–6). 0 on vaalea, 6 on tumma.

Rasvakeitto, värin tasaisuus (1–9). 9 on erittäin tasainen.

Rasvakeitto, tummuminen (1–9). 9 on vaalea.

Rasvakeitto, rakenne (1–9). 9 on erittäin rapea.

Rasvakeitto, maku (1–9). 9 on herkullinen.

Lastupaisto, väri (1–9). 1 on vaalea.

3.4 Rehunurmet

Sadot (kg/ha) ilmoitetaan kuiva-aineena.

Valkuainen (%) määritetään kahdesta kokeesta kunkin korjuukerran sadoista.

Valkuaissato (kg/ha) kuvaa valkuaisen määrää kuiva-aineessa.

Botaaninen analyysi (%) kertoo kokeil-tavan kasvin osuuden sadosta. Määrittys on huomioitu sadon määrässä, joka ilmoittaa koekasvin puhtaan sadon.

Korkeus (cm) on kasvuston keskimääräinen korkeus.

Colour of flesh (1–9). 9 = dark yellow, 7 = yellow, 5 = light yellow, 3 = white, 1 = variegated grey.

Mealiness (1–9). 9 = highest mealiness.

Flavour (1–9). 9 = best taste.

Discoloration cooked (1–9). 9 = least discoloured.

Discoloration fresh (1–9). 9 = least discoloured

Sloughing (1–9). 9 = least sloughed.

French fries colour (0–6). 0 = light, 6 dark.

French fries, uniformity of colour (1–9). 9 = very uniform.

Discolouring after frying (1–9). 9 light.

Crispness after frying (1–9). 9 = very crisp.

Flavour after frying (1–9). 9 = delicious.

Crisping colour (1–9). 1 = light.

3.4 Feed grasses

Yields (kg/ha) are expressed as dry matter yields.

Protein (%) is determined for two trials from yields of each harvest.

Protein yield (kg/ha) is calculated from dry matter yields and protein concentrations.

Botanical analysis (%) percentage in yield of the species tested. The evaluation is included in the size of the yield which states the net yield of the tested species.

Height (cm) is the average height of the stand.

Röyhylle tai tähkälle tulo ja kukkimisen alkaminen (vrk) on päivä, jolloin viisi prosenttia kasveista kyseisessä kehitysvaiheessa. Kehitysvaihe ilmoitetaan vuorokausina toukokuun 1. päivästä lukiin.

Kevättiheys (%) ilmoitetaan kasvun selvästi alettua, 100 on täystiheä.

Talvituho (%) 100 on täysin tuhoutunut.

3.5 Nurmikot

Syys- ja kevätitiheys sekä talvituho (%) ilmoitetaan kuten rehunurmilla.

Kasvuunlähtö (vrk) on päivä, jolloin 50 prosenttia kasviyksilöistä on aloittanut kasvunsa. Kasvuunlähtö ilmoitetaan vuorokausina 1. huhtikuuta alkaen.

Viherpeittävyys keskimäärin (%) on kasvukauden aikana tehtyjen viherpeittävyshavaintojen keskiarvo.

Viherpeittävyys (%) on kylvetyn lajin yksilöiden osuus ruudun pinta-alasta. Viherpeittävyys havainnoidaan kahden viikon välein kolmen–viiden päivän kuluksena. Ensimmäinen havainto tehdään viikon kuluksena kasvun alkamisesta.

Vihreä peittävyys keväällä on toisen havaintokerran tulos.

Vihreä peittävyys keskikesällä on kuudennen havaintokerran tulos.

Värin kesto on ylimääräinen vihreän peittävyyden havainto, joka tehdään syksyllä siinä vaiheessa, kun ilman lämpötila on laskenut pysyvästi laskenut 0 asteeseen tai sen alle.

Kasvu (cm) on kasvukauden aikainen kokonaiskasvu. Mittaus tehdään ennen jokaista niittoa kolmesta kohtaa ruutua. Ensimmäisessä mittauksessa huomioidaan koko kasvuston korkeus. Muilla kerroilla kasvuston korkeudesta vähennetään sängin korkeus.

Coming into ear and start of blossoming (days) date when 5% of the individual plants have reached this stage of development. This stage of development is expressed in days as of 1 May.

Covering % (spring) (100 = full cover) is estimated when growth has clearly started.

Winter damage (%) 100 = total damage.

3.5 Turf grasses

Covering % (autumn/spring) as well as **winter damage %** are determined in the same way as for feed grasses.

Beginning of growth (days) -is the date at which 50% of the individual plants have started to grow. Beginning of growth is expressed in days as of 1 April.

Average green cover % is the mean of green cover observations made during the growing period.

Green cover % is defined as the proportion of species sown in the area of the trial plot. The first observation is made one week after the beginning of growth.

Green cover-% (spring) is the cover at the second observation.

Green cover-% (mid-summer) is the cover at the sixth observation.

Strength of colour is an additional observation of green cover made in autumn when the air temperature has permanently dropped to 0°C or below.

Growth (cm) is the total growth during the growing period. The measurement is made before each cut at three points of the trial plot. In the first measurement the height of the entire stand is recorded and in the other measurements the stubble height is deducted from the height of the stand.

Tilastollinen merkitsevyys
parivertailu: verrannelajike - mittarilajike

o = merkitsevä 10 prosentin tasolla
* = merkitsevä 5 prosentin tasolla
** = merkitsevä 1 prosentin tasolla
*** = merkitsevä 0,1 prosentin tasolla

Statistical significance:
Paired comparison: variety under test vs.
control variety

o = significant at 10% level
* = significant at 5% level
** = significant at 1% level

Markku Niskanen

MTT Etelä-Pohjanmaan tutkimusasema

Timotei, nurminata, koiranheinä, englanninraiheinä, italianraiheinä, westerwoldin raiheinä, puna-apila, valkoapila, ruokohelpi, punanata, niittynurmikka

Yrjö Salo

MTT Lounais-Suomen tutkimusasema

Ruisvehnä, syysvehnä, kevätvehnä, kevätrypsi, kevätrapsi, öljypellava, aurin-gonkukka

Martti Vuorinen

MTT [Hämeen tutkimusasema](#)

Ohra, kaura

Lauri Jauhiainen

Resarchers

Arjo Kangas

MTT South Ostrobothnia Research Station

Head of the official variety trials, potato

Antti Laine

MTT Southwest Finland Research Station

Winter rye, Spring rye, pea, broad bean, narrow-leafed lupin

Markku Niskanen

MTT South Ostrobothnia Research Station

Timothy, meadow fescue, cocksfoot, perennial ryegrass, italian ryegrass, westerwoldian ryegrass, red clover, white clover, reed canary grass, red fescue, kentucky bluegrass

Yrjö Salo

MTT Southwest Finland Research Station

Triticale, winter wheat, spring wheat, spring, turnip rape, spring rape, linseed, sunflower

Martti Vuorinen

MTT Häme Research Station

Barley, oats

Lauri Jauhiainen
