1 Viralliset lajikekokeet

Virallisen lajikekokeiden tehtävänä on selvittää uusien peltokasvilajikkeiden viljelyarvo. Kokeista säädetään Maa- ja metsätalousministriön asetuksessa 51/2004. Peltokasvien viralliset lajikekokeet järjestää Maa- ja elintarviketalouden tutkimuskeskus MTT. Kokeet toteutetaan laatuojärjestelmän mukaan.

Kokeissa selvitetään uusien lajikkeiden viljelyarvoa, viljelyvarmuutta, satoisuutta ja laatua. Lajikkeen omistaja ilmoittaa lajikkeen kokeisiin. Lajike on virallisissa kokeissa yleensä kaksi vuotta tai kunnes se hyväksytään kasvilajikeluetteloon. Tämän jälkeen lajike voi olla täydentävissä kokeissa 2-3 vuotta.

Lajikekokeet tehdään kunkin lajikkeen viljelyyn soveltuvalla alueella. Ne ovat käytännön viljelyä vastaavia kenttäkokeita. Kokeita on vuonna 2008 ollut kaikkiin 13 koepaikalla (Kuva 1). Virallisia lajikekokeita ovat suorittaneet MTT:n toimeksiannosta ProAgria Nylands Svenska Lantbrukssällskap, Perunantutkimuslaitos, Boreal Kasvinjalostus Oy ja K-maatalouden koitala. Sokerijuurikkaan kokeet hoitaa Sokerijuurikkaan tutkimuskeskus.

Nurmikkokasvien lajikekokeet hoidetaan Pohjoismaissa yhteisesti. Tietoa kokeista on sivulla www.scanturf.org.

Kasvilajikeluetteloon otettavat lajikkeet päätetään virallisten lajikekokeiden tulosten perusteella. Lajikeluettelosta päätää Eviran Kasvilajikelautakunta.

1 Official variety trials

Official variety trials are conducted by MTT Agrifood Research Finland to determine the value of new field crop varieties (Ministry of Agriculture and Forestry, Decree 51/2004). The variety trials are performed in accordance with a quality system.

The value, cultivation stability, yield potential and quality of new varieties are evaluated in official variety trials. The proprietor of the variety enters the variety for the trials. The variety undergoes official trials usually for 2 years or until it is entered in the National List of Cultivars. It then undergoes trials for another 2–3 years to produce additional information about the variety.

The trials take place in areas suitable for the cultivation of the crop in question. Variety trials are field trials that simulate practical cultivation. Trials were conducted at 13 trial sites in 2008 (Figure 1). They have also been conducted by ProAgria Nylands Svenska Lantbrukssällskap (a regional agricultural advisory organisation located in the South of Finland), the Potato Research Institute, Boreal Plant Breeding Ltd and the Experimental Farm of the K Group. The sugar beet trials are carried out by the Sugar Beet Research Centre.

Information about Scandinavian turf grass variety trials is available at www.scanturf.org

Decisions on the inclusion of varieties in the National List of Cultivars are based on the results of the official variety trials. The decisions are made by the Plant Variety Board of the Finnish Food Safety Authority Evira.

2 Koetulosten tulkinta

2.1 Yleistä

Tässä julkaisussa on esitetty virallisten lajikekoideiden tulokset vuosilta 2001-2008. Vehnien leivontalaatutulokset ovat vuosilta 2000-2007. Kevätruukiista ei ole tuloksia vuosilta 2003-2004 eikä tärkkelysperunasta vuodelta 2006.

Tulokset on analysoitu käyttää lineaarisia sekamalleja (suoravertailu), jolloin kaikkia lajikkeita voidaan verrata suoraan toisiinsa, sillä malli käyttää koko aineiston hyödykseen yhdellä kertaa.

Yhteenvedoissa ovat mukana satotulokset viljelyvyöhykkeen, maalajin, koevuoden ja satotason mukaan ryhmiteltyinä. Nurmikasvien satotulokset on lisäksi laskettu nurmen iän mukaan eriteltyinä.

Tuloksissa viljojen, öljykasvien ja palkoviljojen lajikkeet ovat kasvuajan mukaisessa järjestysessä. Leivontatulokset ovat jauhosaannon mukaisessa järjestyksestä. Perunalajikkeet on järjestetty tärkkelyspitoisuuden ja rehunurmilajikkeet satoisuuden mukaan.

Rukiin tulokset esitetään jaoteltuna kolmeen alueeseen: Etelä-Suomi, Länsi-Suomi ja Sisä-Suomi. Etelä-Suomeen luetaan Piikkiön, Inkoon ja Pernajan tulokset sekä aikaisemmilta vuosilta Mietoisten, Vihdin ja Tuusulan tulokset. Länsi-Suomeen kuuluvat Jokioisten ja Ylistaron tulokset. Muut koepaikat luetaan kuuuviksi Sisä-Suomeen.

Lajikkeiden viihtyvyyttä voi tarkastella maalajin mukaan ryhmitellyistä tuloksesta. Ohralajikkeilla on eri maalajien koideiden lisäksi vuosittain happamuuden-sietokoe, jossa maan pH on erityisen alhainen.

2 Evaluation of trial results

2.1 General

This annual bulletin presents the results of the official variety trials for 2001-2008. The baking quality results of wheat cover the years 2000-2007. There are no results of spring rye from the years 2003-2004 and of starch potato from the year 2006.

The results were analysed using linear mixed models, which use all available data in the same analysis. In the results all varieties can be compared directly with each other.

The summaries also give yields by cultivation zone, soil, trial year and yield level. The yields of grasses were calculated by the age of the lay. The number of trial results is given only for yields.

The varieties of cereals, oilseeds and pulses are sorted by growing time. The baking quality results are sorted by flour yield. The potato varieties are sorted by starch content. Total yield is used as the sorting factor for feed grass varieties.

The yields of rye are given separately for three regions: Southern Finland, Western Finland and Inner Finland. Piikkiö, Inkoo and Pernaja (and also Mietoinen, Vihti and Tuusula from previous years) are included in Southern Finland. Jokioinen and Ylistaro are included in Western Finland. All the other trial sites are in Inner Finland.

The adaptability of varieties can be evaluated from the results classified by soil type. For barley the tolerance of acidic soils is tested in separate trials.

Viljojen ja öljykasvien taudinkestävyyskokeet on tehty taulukossa 1 esitetyillä koepaikoilla. Koejärjestely on strip-plot – koeasetelman mukainen. Kasvitautien torjuntakäsittely on tehty kaistoina lajikeruutujen yli.

Aineisto on analysoitu sekamallilla, jossa lajike ja ruiskutuskäsittely ovat kiinteitä tekijöitä. Lohko ja koe ovat puolestaan normaalista jakautuneita satunnaistekijöitä. Yhdysvaikutukset on määritelty satunnaisiksi, kun vähintään yksi yhdysvaikutusten tekijöistä on ollut satunnainen.

Ohjeita tulosten tulkintaan:

Kokeita (kpl) ilmoittaa, kuinka monessa kokeessa lajike on ollut.

Sato (kg/ha) on lajikkeen vertailukelpoinen sato keskimääräisissä kasvuolosuhteissa. Sato ilmoitetaan viljoilla 15 prosentin ja öljykasveilla 9 prosentin kosteudessa.

Suhdeluku (SI) on lajikkeen keskimääräinen suhteellinen sato verrattuna mittarin satoon.

2.2 Viljat, palko- ja öljykasvit

Talvituho (%) kuvaa talvituhon keskimääräistä osuutta kasvustosta. Tällöin 100 on täysin tuhoutunut.

Lako (%) kertoo kasvuston keskimääräisestä lakoutumisasteesta. 100 on täysin lakoutunut.

Kasvuaika (vrk) on jakso kylvöstä kelta-tuleentumiseen

Tehois lämpösumma (astepäivää) saadaan, kun lasketaan yhteen kasvukauden vuorokausien keskilämpötilat, joista on vähennetty kynnysarvo viisi astetta (+5 °).

Korkeus (cm) kertoo kasvuston keskimääräisen korkeuden.

The grain and oilseed trials with fungicide treatment were conducted at the sites shown in Table 1. The experimental design at each site was a strip-plot design.

The data were analysed using the mixed model approach, in which the variety and fungicide treatments are assumed to be fixed effects and the trial and block to be normally distributed random effects. Interaction effects involving at least one random effect are also defined as random

Detailed instructions on reading the tables are given in the following.

Trials (no) shows the number of trials in which the variety was included.

Yield (kg/ha) is the estimated mean yield of the variety in average environmental conditions. Grain yields are calculated at 15% and oilseed yields at 9% moisture content.

Rel. is the average yield of the variety relative to the yield of the control variety.

2.2 Cereals, pulses and oilseeds

Winter damage (%) is the average proportion of winter damaged stand, 100 = total loss.

Lodging (%) is the average degree of lodging in the stand, 100 = completely lodged.

Growing time (days) is the time from sowing to yellow ripening

Growing degree days (dd) are calculated from sowing to yellow ripening. +5°C is used as the threshold value.

Length (cm) is the average length of the stand.

1000 jyvän paino (g) on 1 000 siemenen paino.

Hehtolitrapaino (kg) on sadon tilavuus-paino.

Valkuaispitoisuus (%) kertoo, paljonko sadon kuiva-aineessa on valkuaista.

Kuori (%) kuvailee kauran kuoren osuutta sadosta.

Sakoluku 1 on sakoluku normaalina vil-jankorjuuaikana.

Sakoluku 3 on sakoluku kaksi–neljä viikkoa normaalista korjuajankohdasta.

Valkuaissato (kg/ha) kertoo valkuaisen määän kuiva-aineessa

Öljypitoisuus (%) kertoo, paljonko sa-don kuiva-aineessa on öljyä.

Öljysato (kg/ha) on öljysadon määän kuiva-ainesadossa.

Lehtivihreäpitoisuus (ppm) kertoo, pal-jonko siementen öljy sisältää lehtivihreää milligrammoina kilossa.

Keitto 60 min (%) kuvailee pehmenneiden herneiden osuutta, kun niitä on keitetty tunti.

2.3. Vehnän leivontalaatu

Jauhosaanto (%) ilmaisee jauhon mää-rän jauhetusta jyvämäärästä.

Sakoluku (s) esitetään jauhon sakoluku-na.

Valkuais-% esitetään valkuaispitoisuu-tena jauhon kuiva-aineesta.

Kostea sitko (%) on kostean sitkon mää-rän jauhosta.

1000-seed weight (g) is the weight of 1000 seeds of the yield.

Hectolitre weight (Hl-weight, kg) is the weight of 100 litres of the yield.

Protein content (%) is the protein con-tent of the yield as a percentage of dry matter.

Husk (%) is the proportion of oat husk in the yield.

Falling number 1 is the falling number at the normal cereal harvesting time.

Falling number 3 is the falling number 2–4 weeks after the normal harvesting time.

Protein yield (kg/ha) is the amount of protein in the dry matter.

Oil content (%) is the oil content of the dry matter.

Oil yield (kg/ha) is the amount of the oil yield of the dry matter.

Chlorophyll content (ppm) is the chlo-rophyll content (mg/kg) in the seed oil.

Cooking 60 min is the (%) percentage of soft peas after one hour of cooking.

2.3. Baking quality of wheat

Flour yield (%) presents the flour amount of the milled grain amount.

Falling number (s) presents the falling number of the flour.

Protein content % presents protein con-tent on dry matter basis.

Wet gluten (%) is the amount of wet gluten from flour amount.

Zeleny-luku on mittalasissa isopropylalkoholin ja maitohapon seoksessa sekoitetun jauhon liettyneen sitkopatsaan korkeus.

Vedensidonta (%) on vesimäärä jauhon (kosteus 14 %) painosta. Tämä vesimäärä tarvitaan valmistettaessa jauhosta määrätyyn kiinteyden omaavaa taikinaa.

Valorimetriluku ilmaisee taikinan muodostumisajan, sekoituskestävyyden ja pehmenemisen. Se määritetään erityisellä mitta-asteikolla farinogrammista.

Ekstensogrammin pituus (mm) eli taikinan venyyvys on ekstensografin piirtämän käyrän pituus, kun taikinaa venytetään katkeamiseen asti.

Ekstensogrammin korkeus (mm) eli taikinan venytysväistus on ekstensografin piirtämän käyrän korkeus, kun taikinaa venytetään katkeamiseen asti.

Leipätilavuus (ml) on koeleivonnalla paistetun vuokaleivän tilavuus.

Huokoisuus (1-8) koeleivästä leikatun leipäviipaleen huokosten koko Dallmannin Porentabelle –asteikolla. Kun huokosten koko on suuri ja epätasainen arvosana on 1, ja kun huokoset ovat pieniä ja tasaisia arvosana on 8.

Kimmoisuus (0-10) leivän sisuksesta leikatun kuution palautuminen painamisen jälkeen senttimetreinä asteikolla 0 (=2 cm) – 10 (=5 cm).

Arvoluku on (tilavuustekijä x huokoisuustekijä):100. Taulukon avulla muutetaan leivän tilavuus ja huokoisuus tilavuus- ja huokoisuustekijöiksi

Zeleny number is the height of flour gluten pole after shaken in glass isopropyl alcohol and milk acid.

Water absorption (%) is the amount of water of flour weight (moisture 14 %). This water amount is needed to get certain consistency of dough.

Valorimeter value is quality score based on dough development time and tolerance to mixing. It is measured with special measure template from farinogram.

Ekstensograp length (mm) or extensibility of the dough is the length of curve drawn by ekstensograf, when dough is stretched until broken.

Ekstensograp height (mm) or resistance of dough, the height of curve which ekstensograf draw when dough is stretched until broken.

Loaf volume (ml) is the volume of the experiment bread baked in the pan.

Grumb structure (1-8) the volume of the spores of cut from the experiment bread. Dallmanns Porentabelle –scale is used. When the pores are big and uneven the value is 1, and when the pores are small an even the value is 8.

Grumb resilience (0-10) is the end height after pressed loaf cubic, the centimetre scale is 0 (=2 cm) – 10 (=5 cm).

Quality number is (loaf volume value x grumb structure value):100. With the table loaf volume and grumb structure are turned to score point values.

2.4 Peruna

Tärkkelys (%) ilmoittaa perunan tärkkelyspitoisuuden.

Kauppakelppoinen sato (%) on ulkoisen laadun arvostelussa luokkaan terveet sijoitettujen 35–70-millimetristen perunoiden sato. Ulkoisen laadun vaatimukset vastaavat lähinnä ruokaperuna-asetuksen erikoislukion perunan laatuvaatimuksia.

Myöhäisyys (1–9) on arvioitu kokeissa kolmasti 15. elokuuta alkaen 10 vuorokauden välein. Tässä tiedotteessa on esitetty kolmannen havaintokerran tulokset. 9 on täysin tulehtunut.

Mukulan ominaisuudet ja ulkonäkö

Ulkonäkö kuorineen (1–9). 9 tarkoittaa parasta ulkonäköä, 1 on kuori pilalla.

Mukulan pyöreys (1–9). 9 on pyöreä mukula, 1 on pitkänomainen mukula.

Mukulan litteys (1–9). 9 on poikkileikkaukseltaan pyöreä mukula, 1 on poikki-leikkaukseltaan litteä mukula.

Mukulan sileys (1–9). 9 on sileä mukula, 1 on hyvin syväsilmainen ja/tai kyhmyinen mukula

Mukulamuodon säennöllisyys (1–9). 9 tarkoittaa säennöllistä mukulamuotoa, vähiten vaihtelevaa, 1 tarkoittaa hyvin vaihtelevaa mukulamuotoa

Ulkoinen laatu

Ulkoisen laadun arvioinnissa määritetään eri tavalla vioittuneiden mukuloiden osuus painoprosentteina seuraavissa vioitustypeissä:

Terveet (%). Ei vioituksia tai vikoja.

2.4 Potato

Starch (%) is the starch content of potato.

Marketable yield (%) is the yield classified in the external quality evaluation as healthy, size class 35–70 mm. The requirements for external quality correspond mainly to those of the special class in the Finnish Potato Decree.

Maturity (1–9). 9 = fully mature. In the trials, lateness was evaluated three times at intervals of 10 days starting on 15 August. The results of the third observation are given in this bulletin.

Tuber properties and appearance

Smoothness of skin (1–9). 9 = best appearance, 1 = skin spoiled.

Roundness of tuber (1–9). 9 = round, 1 = elongated.

Flatness of tuber (1–9). 9 = round in cross section, 1 = flat in cross section.

Shallowness of eyes (1–9). 9 = smooth tuber, 1 = very deep eyes and/or knobby tuber.

Uniformity of tuber shape (1–9). 9 = very regular, least variable 1 = very variable.

External appearance

The evaluation of the external appearance is based on the proportion of tubers damaged in different ways, expressed as the percentage by weight in the following groups according to the type of damage:

Healthy tubers (%). Tubers without injuries or defects causing rejection.

Rupi (%). Mukulat, joissa yli 10 prosenttia pinnasta ruven peitossa.

Mukularutto (%).

Muut sienimädät (%).

Bakteerimädät (%).

Mekaaniset pintaviaat (%). Kuori vahingoittunut, eikä vika poistu normaalissa kuorinnassa.

Mekaaniset maltoviat (%). Ehyen kuron alla olevat mekaaniset vauriot, jotka eivät poistu normaalissa kuorinnassa.

Nestejännityshalkeamat (%). Vioitus ei poistu normaalissa kuorinnassa.

Korkkiutuneet halkeamat (%). Vioitus ei poistu normaalissa kuorinnassa.

Ontot ja keskeltä ruskettuneet (%).

Epämuotoiset (%). Lajikkeelle ominaisen muodon poikkeama, joka aiheuttaa vaikeuksia konekuorinnassa. Korjaamisen leikkaamalla aiheuttaa yli 25 prosentin tappion.

Mallon värvirheet (%). Mallon värimuutos, jolle ei ole mekaanista syytä. Tähän ryhmään luetaan myös maltokaari-viruksen aiheuttamat vioitukset ja johtojänneviat.

Vihertyneet (%).

Muut viat (%). Perunan kauppakelposuuteen vaikuttava vika, joka ei kuulu mihinkään edellä mainittuun ryhmään.

Common scab (%). Over 10% of tuber surface.

Tuber blight (%).

Other fungal disease (%).

Bacterial disease (%).

Mechanical damage (%). Skin damage which is not removed by normal peeling

Internal bruising (%). Internal bruising which is not removed by normal peeling.

Harvest crack (%). Injury which cannot be removed by normal peeling.

Growth crack (%). Injury which cannot be removed by normal peeling.

Hollow heart (%). Hollow and dark heart.

Deformations (%). Deviation from the shape typical of the variety which causes difficulty in mechanical peeling; correction by cutting causes a loss of over 25%.

Discoloration (%). Discoloration of flesh which is not due to a mechanical reason. Injuries caused by mop top virus are included in this group

Sun greening (%).

Other defects (%). A defect affecting the marketability of the potato not included in any of the above mentioned groups.

Keittolaadun muuttujat

Ulkonäkö keitettyvä (1–9). 9 on erinomainen.

Mallon väri keitettyvä (1–9). 9 on tumman keltainen, 7 on keltainen, 5 on vaalean keltainen, 3 on valkoinen, 1 on harmaan kirjava.

Jauhoisuus. 9 kuvailee suurinta jauhoisuutta.

Maku (1–9). 9 on paras maku.

Tummuminen keitettyvä (1–9). 9 on vähiten tummumista.

Raakatummuminen (1–9). 9 on vähiten raakatummumista.

Rikkikiehuminen (1–9). 9 on vähiten rikkikiehumista.

2.5 Rehunurmeksi

Sadot (kg/ha) ilmoitetaan kuiva-aineena.

Botaaninen analyysi (%) kertoo kokeiluvan kasvin osuuden sadosta. Määritys on huomioitu sadon määrässä, joka ilmoittaa koekasvin puhtaan sadon.

Röyhylle tai tähkälle tulo ja kukkimen alkaminen (vrk) on päivä, jolloin viisi prosenttia kasveista kyseisessä kehitysvaiheessa. Kehitysvaihe ilmoitetaan vuorokausina toukokuun 1. päivästä lukien

Kevättiheys (%) ilmoitetaan kasvun selvästi alettua, 100 on täystiheä.

Talvituho (%) 100 on täysin tuhoutunut.

Nurmisadon laatu määritetään NIRS-teknikalla eli lähi-infrapuna-heijastusspektroskopialla.

D-arvo (%) Sulavan orgaanisen aineen osuus kuiva-aineesta.

Quality after cooking

Skin cooked (1–9). 9 = excellent.

Colour of flesh (1–9). 9 = dark yellow, 7 = yellow, 5 = light yellow, 3 = white, 1 = variegated grey.

Mealiness(1–9). 9 = highest mealiness.

Flavour (1–9). 9 = best taste.

Discoloration cooked (1–9). 9 = least discoloured.

Discoloration fresh (1–9). 9 = least discoloured.

Sloughing(1–9). 9 = least sloughed

2.5 Feed grasses

Yields (kg/ha) are expressed as dry matter yields.

Botanical analysis (%). Percentage in yield of the species tested. The evaluation is included in the size of the yield which states the net yield of the tested species.

Coming into ear and start of blossoming (days) date when 5% of the individual plants have reached this stage of development. This stage of development is expressed in days as of 1 May.

Covering % (spring) (100 = full cover) is estimated when growth has clearly started.

Winter damage (%). 100 = total damage.

NIRS (near infrared spectroscopy) is used to determinate the quality of grass.

D value (%) Digestible organic matter in the dry matter.

NDF (%) Neutraalidetergentikuitu eli solunseinämäkuitu.

ADF (%) Happoon liukenenematon kuitu.

Ligniini (%) Ligniinipitoisuus.

Valkuaisato (kg/ha) NIRS-analyysin typpiarvon perusteella kertoimella 6,25 laskettu sadon valkuaispitoisuus on kerrottu sadolla.

Käyttökelpoinen sato (kg/ha). Sadon sulavan kuiva-aineen määrä hehtaaria kohti.

NDF (%) Neutral Detergent Fiber.

ADF (%) Acid Detergent Fiber.

Lignin (%). Lignin content

Protein yield (kg/ha). Protein content based on NIRS analysis.

Digestible yield (kg/ha). Digestible organic matter in the dry matter yield.

2.6 Tilastollinen merkitsevyys

Merkitsevydet ilmoittavat kuinka todennäköistä on, että ero testattavan lajikkeen ja mittarilajikkeen välillä on pelkästään sattumasta johtuva. Käytetyt tasot ovat seuraavat:

o = merkitsevä 10 prosentin tasolla

* = merkitsevä 5 prosentin tasolla

** = merkitsevä 1 prosentin tasolla

*** = merkitsevä 0,1 prosentin tasolla

2.6 Statistical significance

Significance levels show how likely a difference between test and control variety is due to chance. The levels used are:

o = significant at 10% level

* = significant at 5% level

** = significant at 1% level

*** = significant at 0.1% level

2.7 Lisätietoja

Lajikekokeiden laatuksikirja, suoritusohjeet ja muuta lajikekokeisiin liittyvä tietoa on saatavilla osoitteesta www.mtt.fi/lajikekokeet.

2.7 Additional information

A quality manual for variety trials, instructions for use and other relevant information are available (in Finnish) at www.mtt.fi/lajikekokeet.

Antti Laine

MTT Plant Production Research, Piikkiö

Winter rye, spring rye, pea, broad bean, narrow-leaved lupin, maize

Markku Niskanen

MTT Plant Production Research, Ylistaro

Timothy, meadow fescue, cocksfoot, perenniel ryegrass, Italian ryegrass, wester-woldian ryegrass, red clover, white clover, reed canary grass, red fescue, Ken-tucky bluegrass.

Yrjö Salo

MTT Plant Production Research, Piikkiö

Triticale, winter wheat, spring wheat, spring turnip rape, winter turnip rape, spring rape, linseed, camelina, sunflower.

Martti Vuorinen

MTT Plant Production Research, Piikkiö

Barley, oats.

Lauri Jauhainen

MTT Service Unit, Jokioinen

Statistical methods.
