Virallisia lajikekokeita tehdään uusien kasvilajikkeiden viljelyarvon arvioimiseksi. Tiedot kasvilajikkeiden satoisuudesta, viljelyominaisuuksista ja sadon laadusta auttavat viljelijöitä ja pellon tuotteiden jalostajia valitsemaan oikeat lajikkeet käyttöönsä. Myös kasvilajikeluetteloon otettavat lajikkeet päättäään virallisten lajikekokeiden tulosten perusteella. Lajikkeiden viljelyarvoa arvioidaan käytännön viljelyä vastaavissa kentäkokeissa, joissa uusia lajikkeita verrataan tunnettuihin mittarilajikkeisiin. Kokeet toteutetaan valtakunnallisesti kattavasti, vuonna 2015 kahdellatoista koepaikalla. Lisäksi järjestetään erilliset kokeet viljojen taudinkestävyyden ja ohralajikkeiden happamuudenkestävyyden selvittämiseksi. Myllyvehnistä määritetään leivontalaatu.

Uuden kasvilajikkeen viljelyarvo selvitetään kahden vuoden kokeilla. Monivuotisilla nurmikasveilla koejakso kestää kuitenkin perustamisvuoden jälkeen kolme satovuotta. Lajikeluetteloon hyväksytystä lajikkeesta voidaan peruskoejakson jälkeen tehdä täydentäviä neuvonnallisia kokeita. Lajikekokeiden tulokset esitetään kahdeksan vuoden yhdistelminä. Tulokset analysoidaan käyttäen lineaarisia sekamalleja.

Asiasanat: lajikkeet, leipävilja, rehuvilja, palkokasvit, öljykasvit, nurmikasvit, peruna

Abstract

The purpose of the official variety trials is to evaluate plant varieties for the value for cultivation and use. Information about the yield potential and suitability for cultivation and the crop quality help farmers and processing industry to choose the best varieties for their purposes. The decision to accept a variety to the official plant variety list is also based on the results of the official variety trials. The value for cultivation and use is assessed in field trials where new varieties are cultivated in common cultivation methods side by side with well known varieties.

The official variety trials include all cropping zones in Finland. In 2015 the trials were located in 12 trial sites. Along with the field trials there are separate trials to estimate crop varieties' resistance to plant diseases and barley varieties' tolerance for low pH in soil. The baking quality of bread wheat varieties is assessed in a baking laboratory.

The official variety tests take two years on annual plants and on perennial grasses the evaluation is based on the results of three years. After a variety has been added to the official plant variety list it is allowed to be tested in the official variety trials as an advisory variety.

The results of the variety trials are summaries over the past eight years. The results are analyzed using a linear mixed model procedure so that the estimated means of the varieties are comparable despite of different trial years.

Keywords: plant varieties, bread grain, fodder grain, leguminous plants, oil plants, pasture plants, potato

1. Viralliset lajikekokeet

Virallisten lajikekokeiden tehtävänä on selvittää uusien peltokasvilajikkeiden viljelyarvo. Kokeista säädetään maa- ja metsätalousministeriön asetuksessa 51/2004. Peltokasvien viralliset lajikekokeet järjestää Luonnonvarakeskus (Luke). Kokeet toteutetaan laatujärjestelmän mukaan.

Kokeissa selvitetään uusien lajikkeiden viljelyarvoa, viljelyvarmuutta, satoisuutta ja laatuja. Lajikkeen omistaja ilmoittaa lajikkeen kokeisiin. Lajike on virallisissa kokeissa yleensä kaksi vuotta tai kunnes se hyväksytään kasvilaajikeluetteloon. Tämän jälkeen lajikkeen omistaja voi vielä halutessaan ilmoittaa lajikkeen lisäkokeisiin.

Lajikekokeet tehdään kunkin lajikkeen viljelyyn soveltuvalla alueella. Ne ovat käytännön viljelyä vastaavia kenttäkokeita. Kokeita oli vuonna 2015 kaikkiaan 12 koepaikalla (Kuva 1). Virallisia lajikekokeita suorittavat Luken toimeksiannosta ProAgria Nylands Svenska Lantbruksällskap, Boreal Kasvinjalostus Oy ja K-maatalouden koetila. Sokerijuurikkaan lajikekokeet hoitaa Sokerijuurikkaan tutkimuskeskus.

Vehnien koeleivonnat tehdään Eviran Viljalaboratoriassa.

Nurmikkokasvien lajikekokeet hoidetaan Pohjoismaisenä yhteistyönä. Kokeiden koordinoinnista vastaa Norwegian Institute of Bioeconomy Research (NIBIO), joka toimii Norjan maatalous- ja elintarvikeministeriön alaisuudessa. Suomen osalta kokeiden yhdyshenkilöön toimii Markku Niskanen.

Kansalliseen kasvilaajikeluetteloon otettavat lajikkeet päätetään virallisten lajikekokeiden tulosten perusteella. Lajikeluettelosta päätää Eviran Kasvilaajikelautakunta.

1 Official variety trials

Official variety trials are conducted by Natural Resources Institute Finland (Luke) to determine the value of new field crop varieties (Ministry of Agriculture and Forestry, Decree 51/2004). The variety trials are performed in accordance with a quality system.

The cultivation value, stability, yield potential and quality of new varieties are evaluated in official variety trials. The proprietor of the variety enters the variety for the trials. The variety undergoes official trials usually for 2 years or until it is entered in the National List of Cultivars.

The trials take place in areas suitable for the cultivation of the crop in question. Variety trials are field trials that simulate practical cultivation. Trials were conducted at 12 trial sites in 2015 (Figure 1). They are also conducted by ProAgria Nylands Svenska Lantbruksällskap (a regional agricultural advisory organisation located in Southern Finland), Boreal Plant Breeding Ltd and the K-Group Experimental Farm. The sugar beet variety trials are carried out by the Sugar Beet Research Centre.

The baking quality tests of bread wheat are made by the Grain Laboratory of the Finnish Food Safety Authority Evira.

The turf grass trials take place in Scandinavian cooperaration and the variety trials are conducted by the Norwegian Institute of Bioeconomy Research (NIBIO) which is a merger between the Norwegian Institute for Agricultural and Environmental Research, the Norwegian Agricultural Economics Research Institute and the Norwegian Forest and Landscape Institute. In Finland the contact person is Markku Niskanen.

Decisions on the inclusion of varieties in the National List of Plant Varieties are based on the results of the official variety trials. The decisions are made by the Plant Variety Board of the Finnish Food Safety Authority Evira.

2. Koetulosten tulkinta

2.1. Yleistä

Tässä julkaisussa on esitetty virallisten lajikeiden tulokset vuosilta 2008 – 2015. Vehnien leivontalaatutulokset ovat toistaiseksi vuosilta 2008 – 2014.

Tulokset on analysoitu käyttäen lineaarisia sekamalleja (suoravertailu). Tällöin kaikkia lajikkeita voidaan verrata suoraan toisiinsa, sillä malli käyttää koko aineiston hyödykseen yhdellä kertaa.

Satotulokset on esitetty yhteenvedoissa viljelyvyöhykkeen, koevuosien, maalajin ja satotason mukaan ryhmiteltyinä. Nurmikasvien satotulokset on lisäksi laskettu nurmen iän mukaan eriteltyinä.

Maalajin ja satotason mukaisilla ryhmitellyillä tarkastellaan lajikkeiden viihtyvyyttä. Ohralajikkeilla on lisäksi erillinen happamuuden sietokoe, jossa maan pH on erityisen alhainen.

Viljojen, öljykasvien ja palkoviljojen lajikkeet ovat tuloksissa kasvualan mukaisessa järjestysessä. Vehnien leivontatulokset ovat jauhosaannon mukaisessa järjestysessä. Rehunurmilajikkeet on tuloksissa järjestetty kokonaishan mukaan.

Aineisto on analysoitu sekamalliilla, jossa lajike on kiinteä tekijä. Lohko ja koe ovat puolestaan normaalista jakautuneita satunnaistekijöitä. Yhdysvaikutukset on määritelty satunnaisiksi, kun vähintään yksi yhdysvaikutusten tekijöistä on ollut satunnainen.

Ohjeita tulosten tulkintaan:

Kokeita (kpl) ilmoittaa, kuinka monesta kokeesta lajikkeella on tuloksia.

Sato (kg/ha) on lajikkeen vertailukelpoinen sato keskimääräisissä kasvuolosuhteissa. Sato ilmoitetaan viljoilla ja palkokasveilla 15 prosentin ja öljykasveilla 9 prosentin kosteudessa.

Suhdeluku (SI) on lajikkeen keskimääräinen suhteellinen sato verrattuna mittarin satoon.

2 Evaluation of results

2.1 General

This annual bulletin presents the results of the official variety trials for 2008 – 2015. The results of baking quality tests on wheat cover the years 2008 – 2014.

The results have been analysed with linear mixed models, which use all available data in the same analysis. In the results all varieties can be compared directly with each other.

The summaries give yields by cropping zones, trial years, soil types and yield levels. The yields of grasses were calculated also by the age of the lay.

The results classified by soil types and yield levels can be used to evaluate the adaptability of varieties. The tolerance of low pH in soil has been tested on barley in a separate trial.

The varieties of cereals, oilseeds and pulses have been sorted by growing time. The baking quality results have been sorted by flour yield. The feed grass varieties have been sorted by the total yield.

The data has been analysed by using the mixed model approach in which the variety is assumed to be a fixed effect and the trial and block to be normally distributed random effects. Interaction effects involving at least one random effect are also defined as random.

Detailed instructions on reading the tables are given below:

Trials indicates the number of trials in which the variety has been assessed.

Yield (kg/ha) is the estimated mean yield of the variety considering environmental conditions. The yields of grains and pulses are calculated in 15 % and oilseed yields in 9 % moisture content.

Ratio (Rel.) is the average yield of the variety relative to the yield of the control variety.

2.2. Viljat, palko- ja öljykasvit

Talvituho (%) kuvaa talvituhon keskimääriä osuutta kasvustosta. Tällöin 100 on täysin tuhoutunut.

Lako (%) kertoo kasvuston keskimääriäsestä lakoutumisasteesta. 100 on täysin lakoutunut.

Kasvuaika (vrk) on jakso kylvöstä keltatu-leentumiseen.

Tehoisa lämpösumma (astepäivään) saadaan, kun lasketaan yhteen kasvukauden vuoro-kausien keskilämpötilat, joista on vähennetty kynnysarvo viisi astetta (+5 °).

Pituus (cm) kertoo kasvien keskimääriäisen korkeuden.

Tjp (g) on 1000 siemenen paino.

Hehtolitrapaino (kg) on sadon tilavuus-pai-no.

Valkuaispitoisuus (%) kertoo, paljonko sadon kuiva-aineessa on valkuista.

Lajittelu (%) on 2.5 mm seulan päälle jäät-vien jyvien osuus sadosta.

Tärkkelys (%) kuvaa jyvien tärkkelyspitoisuutta.

Kuori (%) kuvaa kauran kuoren osuutta sa-dosta.

Sakoluku 1 on sakoluku normaalina viljan-korjuuaikana.

Valkuaissato (kg/ha) kertoo valkuaisen määräni kuiva-aineessa.

Öljypitoisuus (%) kertoo, sadon öljypitoisuu-den 9 % kosteudessa.

Öljysato (kg/ha) on öljysadon määrä kui-va-ainesadossa.

Lehtivihreäpitoisuus (ppm) kertoo, pal-jonko siementen öljy sisältää lehtivihreää mil-ligrammoina kilossa.

Keitto 60 min (%) kuvaa pehmenneiden herneiden osuutta, kun niitä on keitetty tunti.

2.2 Cereals, pulses and oil-seeds

Winter damage (%) is the average proportion of winter damaged stand, 100 = total loss.

Lodging (%) is the average amount of lodging in the stand, 100 = completely lodged.

Growing time (days) is the time from sowing to yellow ripening.

Temperature sum (dd) is days calculated from sowing to yellow ripening. +5 °C is used as the threshold value for calculation.

Length (cm) is the average height of the plants.

1000-seed weight (g) is the weight of 1000 seeds of the yield.

Hectolitre weight (Hl-weight, kg) is the weight of 100 litres of the yield.

Protein content (%) is the protein content of the yield as a percentage of dry matter.

Sieving (%) describes the seed size. It is the proportion of seeds on the top of 2.5 mm sieve.

Starch (%) is the proportion of starch in the yield.

Husk (%) is the proportion of oat husk in the yield.

Falling number 1 is the falling number at the normal cereal harvesting time.

Protein yield (kg/ha) is the amount of protein in the dry matter.

Oil content (%) is the oil content of the yield at 9 % moisture.

Oil yield (kg/ha) is the amount of the oil yield of the dry matter.

Chlorophyll (ppm) is the chlorophyll content mg/kg in the seed oil.

Cooking 60 min (%) is the percentage of soft peas after one hour of cooking.

2.3. Vehnän leivontalaatu

Jauhosaanto (%) ilmaisee jauhon määärän jauhetusta jyvämaärästä.

Sakoluku (s) esitetään jauhon sakolukuna.

Valkuais-% esitetään valkuaispitoisuutena jauhon kuiva-aineesta.

Kosteaa sitko (%) on kostean sitkon määrä jauhosta.

Zeleny-luku on mittalaisissa isopropylalcoholin ja maitohapon seoksessa sekoitetun jauhon liettyneen sitkopatsaan korkeus

Vedensidonta (%) on vesimäärä, joka tarvitaan määrätyyn kiinteyden omaavan taikinan valmistettamiseen jauhosta (kosteus 14 %).

Valorimetriluku ilmaisee taikinan muodostumisajan, sekoituskestävyyden ja pehmenemisen. Se määritetään erityisellä mittasteikolla farinogrammista.

Ekstensogrammin pituus (mm) eli taikinan venyvyys on ekstensografin piirtämän käyrän pituus, kun taikinaa venytetään katkeamiseen asti.

Ekstensogrammin korkeus (mm) eli taikinan venytysvastus on ekstensografin piirtämän käyrän korkeus, kun taikinaa venytetään katkeamiseen asti.

Ekstensogrammin pinta-ala (cm²) eli ekstensografin piirtämän käyrän rajaaman alueen pinta-ala, kun taikinaa venytetään katkeamiseen asti.

Taikinan pehmenemisaste (FU) määritetään farinografilla.

Tuhka (%) kuiva-aineessa.

2.4. Rehunurmet

Sadot (kg/ha) ilmoitetaan kuiva-aineena.

Botaaninen analyysi (%) kuvailee testattavan kasvin osuutta sadosta. Määritys on huomioitu koekasvin puhtaan sadon määrässä.

Röyhylle tai tähkälle tulo ja kukinnan alkaminen (vrk) ilmoittaa päivien määärän toukokuun 1. päivästä siihen asti, jolloin viisi prosenttia kasveista on tässä kehitysvaiheessa.

2.3 Baking quality of wheat

Flour yield (%) presents the flour amount of the milled grain amount.

Falling number (s) is the falling number of the flour.

Protein content (%) presents protein content in dry matter.

Wet gluten (%) is the amount of wet gluten from the amount of flour.

Zeleny number is the height of flour gluten pole after shaking in the mixture of isopropyl alcohol and lactic acid.

Water absorption (%) is the amount of water needed to obtain a specified consistency of dough (starting with flour at 14 % moisture).

Valorimeter value is a quality score based on dough development time and tolerance to mixing. It is measured with a farinogram.

Extensogram length (mm) or extensibility of the dough is the length of the curve drawn by an extensograph, when the dough is stretched to breaking point.

Extensogram height (mm) or resistance of dough is the height of the curve which an extensograph draws when the dough is stretched to breaking point.

Extensogram area (cm²) is the area confined by the curve drawn by an extensograph, when the dough is stretched to breaking point.

Degree of softening (FU) has been tested in a farinograph

Ash (%) in dry matter.

2.4 Grasses for feed

Yields (kg/ha) are expressed in dry matter.

Botanical analysis (%) describes the percentage of the tested plant species in the yield. The evaluation is included in the net yield.

Coming into ear and start of blossoming (days) expresses the number of days from May 1st to the date when 5 % of the plants have reached this growth stage.

Syystiheys (%) ilmoittaa peittävyyden kasvun päätyttyä, 100 = täyspeittävyyss

Kevättiheys (%) ilmoittaa peittävyyden kasvun selvästi alettua, 100 = täyspeittävyyss

Talvituho (%) ilmoittaa syys- ja kevättiheyden eron, 100 = täysin tuhoutunut

Nurmisadon laatu määritetään NIRS-teknikalla eli lähi-infrapuna-heijastusspektroskopialla.

D-arvo (g/kg ka) kuvailee sulavan orgaanisen aineen määriä kuiva-aineessa

NDF (g/kg ka) neutraalidetergenttikuitu eli solunseinämäkuitu kertoo kokonaiskuitumääärän sadon kuiva-aineessa

iNDF (g/kg ka) kertoo neutraalidetergenttikuidun sulamattoman osan määriä

Ligniini (g/kg ka) kuvailee kuiva-aineen ligniinipitoisuutta

Sokeri (g/kg ka) kertoo kuiva-aineen sokeripitoisuuden

ME (MJ/kg ka) Muuntokelpoisen energian määriä eli energia-arvo kuiva-aineessa

Valkuaisasto (kg/ha) on NIRS-analyysilla saatu N-% kerrottuna 6,25 ja kuiva-ainesadolla

Käytökelpoinen sato (kg/ha). Sadon sulavan kuiva-aineen määriä.

2.5. Tilastollinen merkitsevyys

Merkitsevydet ilmoittavat todennäköisyyden, että ero testattavan lajikkeen ja mittarilajikkeen välillä on pelkästään sattumasta johtuva. Käytetyt tasot ovat seuraavat:

o = merkitsevä 10 prosentin tasolla

* = merkitsevä 5 prosentin tasolla

** = merkitsevä 1 prosentin tasolla

*** = merkitsevä 0.1 prosentin tasolla

2.6. Lisätietoja

Lajikekokeisiin liittyvää tietoa on saatavilla osoitteesta www.luke.fi/lajikekokeet.

Autumn Cover (%) is assessed when growth has stopped (100 = full cover)

Spring Cover (%) is assessed when growth has clearly started (100 = full cover)

Winter damage (%) is the difference between autumn and spring cover, 100 = total winter damage.

NIRS (near infrared spectroscopy) is used to determinate the quality of grass.

D value (g/kg DM) Digestible organic matter in the dry matter

NDF (g/kg DM) Neutral Detergent Fiber i.e. total fiber content in the dry matter

iNDF (g/kg DM) Indigestible Neutral Detergent Fiber in the dry matter

Lignin (g/kg DM) Lignin content in the dry matter

Sugar (g/kg DM) Sugar content in the dry matter

ME (MJ/kg DM) Metabolisable energy content in the dry matter

Protein yield (kg/ha). Protein content of the yield based on NIRS analysis.

Digestible yield (kg/ha). Digestible organic matter in the dry matter yield.

2.5 Statistical significance

Significance levels show how likely the difference between test and control variety is due to chance. The levels used are:

o = significant at 10 percent level

* = significant at 5 percent level

** = significant at 1 percent level

*** = significant at 0.1 percent level
